QuickCart Support Automation Workflow

An end-to-end Gen AI project integrating Google Forms, Google Sheets, and n8n

This project automates customer support ticket handling for QuickCart. Customers submit issues through a **Google Form** covering four categories: Payment, Delivery, Technical, and General Issues. Each response is instantly logged into a connected **Google Sheet**, which acts as the central data store.

An **n8n workflow** then automates the response process. The workflow is triggered manually (or on a schedule), reads new rows from the Google Sheet via the "Get row(s) in sheet" node, and passes each entry to a **Switch node**, which routes the ticket based on its Issue Category. Each branch connects to a dedicated **Gmail node** that sends a tailored, HTML-formatted acknowledgement email back to the customer for that specific issue type.

This pipeline demonstrates a practical Gen AI-adjacent automation pattern: structured data collection, conditional logic, and automated multi-channel response — reducing manual support triage time significantly.

1. n8n Automation Workflow

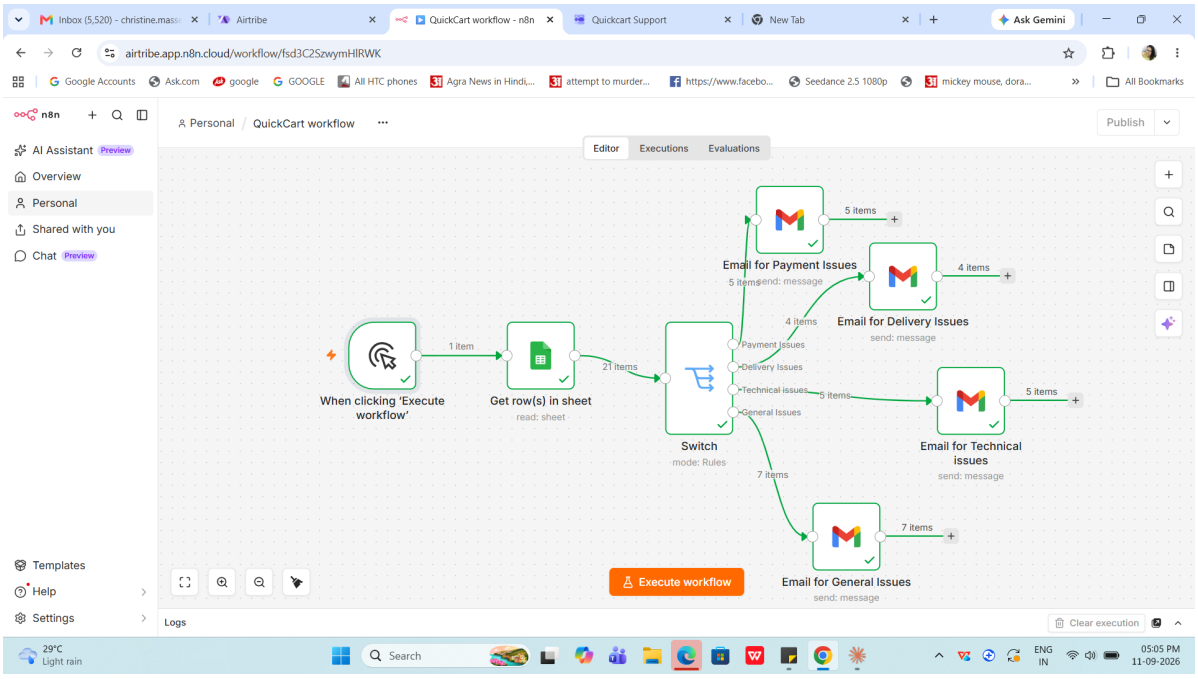

Figure 1: The n8n workflow — Trigger → Get rows in Google Sheet → Switch (by Issue Category) → Gmail nodes sending category-specific replies.

2. Google Form (Data Collection)

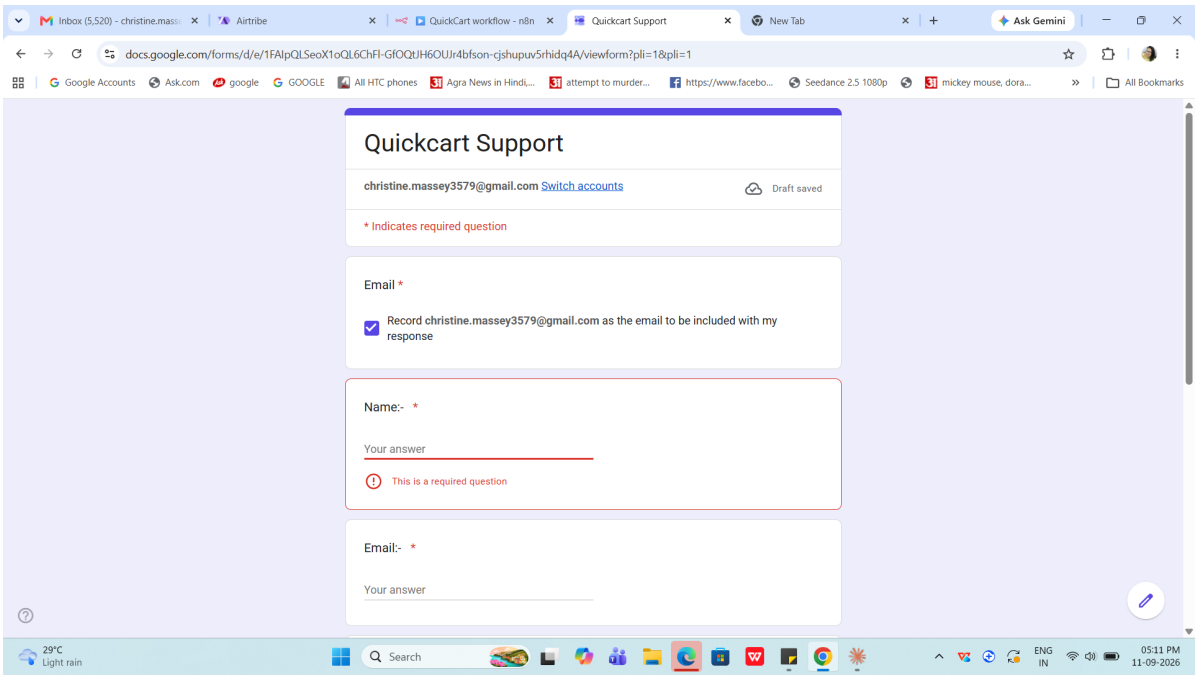

Figure 2: The QuickCart Support intake form where customers enter their Name, Email, Issue Category, and Message.

3. Google Sheet (Data Store)

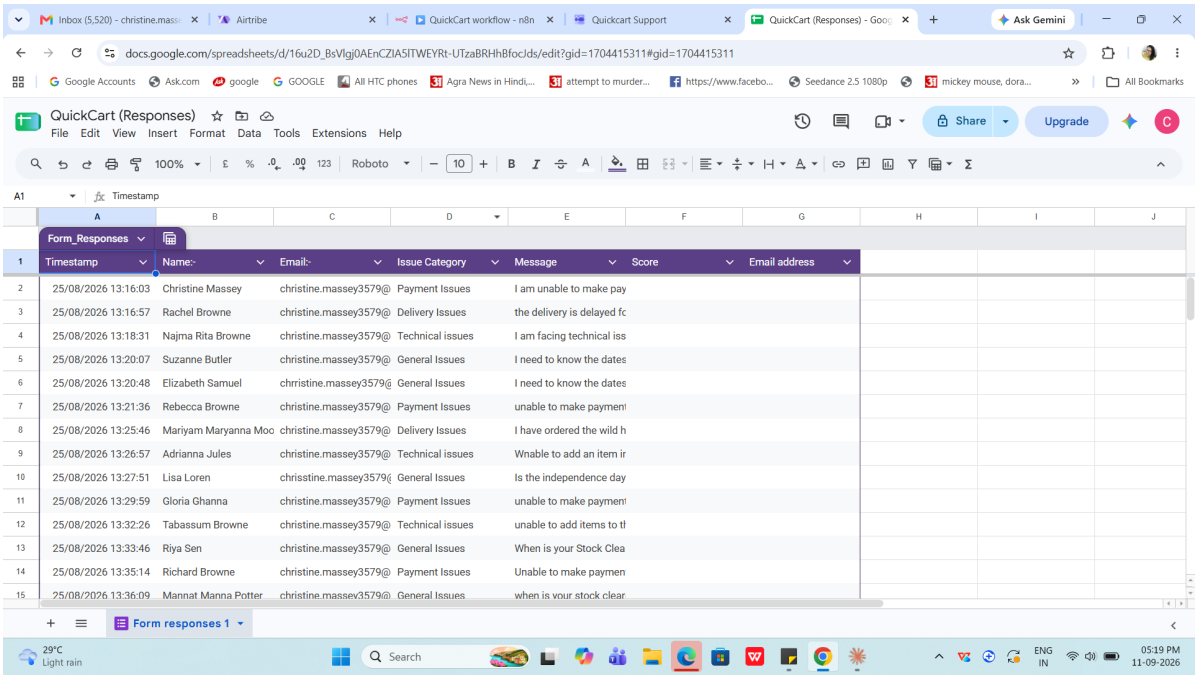

Figure 3: The linked Google Sheet capturing every form submission, which n8n reads to trigger the email automation.
